

A NIMBUS STUDIO STORYBOOK

Cloud **Safety**, Explained

A gentle tour of how three little friends — 🐻
🦊 🦉 — keep their things safe up in the clouds.

What we'll **wander** through

01

The why Why small slips matter more than clever break-ins.

02

The shape What a safe cloud actually looks like. 🐻

03

The habits Good keys, careful sharing, and a spare copy.

04

The choices Three little forks, each with a verdict. 🦊

05

The plan A gentle first week, one calm step at a time.

06

The promise Cosy, careful, and kind to your future self. 🦉

WHY IT MATTERS

9 in 10

Most mishaps in the cloud are not clever break-ins — they start with a small, *human* slip: a shared link left open, a forgotten password, a door nobody locked.

Three little figures

81%

of break-ins lean on a weak or borrowed password. 🦊

5s

is all two-step login asks of you each morning. 🐻

1

spare copy turns a very bad day into a small one. 🦉

THE THREE PILLARS

The shape of a **safe** cloud

Confidentiality Only the right friends can peek inside.

 keeps the honey jar lidded.

Integrity Nothing changes without you knowing. 

notices if even one acorn moves.

Availability Your things are there when you reach for

them.  keeps the lights on at night.

Friends that **help** you stay safe

Password manager

Invents and remembers a strong, unique key for every door, so your brain only carries one.

Two-step login

A

second little check after your password — a code that lives only on your phone.

Encrypted backup

A

spare copy, scrambled and kept apart, waiting quietly for the day you need it. 🦉

Link expiry

A gentle

timer on shared links, so a quick hand-off doesn't wander forever.

Three friends, three **jobs**

The Keeper

Watches the honey jar — decides who may peek inside, and keeps the lid on tight.

The Watcher

Notices when a single acorn shifts — the one who spots a strange email a beat early.

The Night-light

Keeps the lamps lit and a spare copy ready, so nothing is ever truly lost.

Two keys are better than **one** 🐻

Concept Add a second little check after your password — a code from your phone.

Appeal Even if someone learns your password, they still can't get in.

Reality It takes five seconds and stops almost every sneaky login.

Verdict — Turn it on everywhere. This is the single kindest thing you can do for yourself. 🐻

A RISKY SHORTCUT

"I'll just reuse this **password**"

Concept One easy password, used on every single door, so it's simple to remember.

Appeal Nothing new to memorise — log in fast, move on with your day.

Reality One leak anywhere, and every door you own swings open at once.

Verdict — Don't. Give each door its own key, and let a password manager carry the ring. 

HANDLE WITH CARE

Sharing a **link** with the world

Concept "Anyone with the link can view" — one tap, and your file is shareable.

Appeal No accounts, no fuss; perfect for a quick hand-off to a friend.

Reality Links wander. Forwarded, indexed, screenshotted — they outlive the moment.

Verdict — Fine for the harmless stuff. Pause and set an expiry before sharing anything tender. 

A sticky note vs a **manager**

The sticky note Keys scribbled where you can see them — easy to read, and just as easy for anyone else to read too. 🐭

The password manager One locked vault that invents strong, unique keys and hands them over only to you. 🦊

Pick the **gentlest** door

Public link Anyone who finds it walks right in. Lovely for posters, risky for secrets.

Link with expiry A door that politely locks itself after the moment has passed. 🦉

Named invite Only the friends you name may enter — the snuggest fit for tender things. 🐻

One change, two **mornings**

Without two-step A leaked password is a wide-open door, and you may never hear the hinge creak. 🦊

With two-step That same leak hits a second locked gate — the sneaky login simply stops. 🐻

FOUR GENTLE LAWS

Rules the village **lives** by

Least privilege Give each friend only the keys they truly need — no more.

Trust, but verify A friendly face is lovely; a quick check is wiser. 🦊

Patch early Tiny cracks let weather in. Fix the little ones before they grow.

Back it up A second copy, kept apart, turns a bad day into a small one. 🦉

Three small **taps**

Open settings

Find "Security" in your account, then "Two-step verification".

Add your phone

Scan the little square with an authenticator app — it starts ticking out codes.

Save the spares

Tuck the backup codes somewhere safe, in case the phone wanders off.

How **cloud-ready** are you?

Good habit	Doing it?	Why it helps
Unique passwords everywhere		One leak can't unlock the rest
Two-step login switched on		A second key stops sneaky logins
Old share links cleaned up		Wandering links quietly add up
Regular backups, kept apart		Without it, one bad day is forever

Conclusion — Two greens is a fine start. Tend the amber and the red this week, and the village sleeps easy. 🐻

Five calm **steps**

1

Pause

Don't panic and don't delete. Take a breath.

2

Disconnect

Step the device off the network so nothing spreads.

3

Change keys

Reset the password and revoke active sessions.

4

Tell someone

A trusted friend or helper makes it lighter.

5

Learn

Note what slipped, so the door stays shut next time.

When habits **meet** the real world

Strange email → Hover, don't click → Phishing dodged 🦉

New app wants access → Grant the least it needs → Nothing over-shared 🐻

Laptop left at the café → Remote-lock from your phone → Calm, not chaos 🦊

A short **history** of keeping safe

1960s Passwords

arrive — the first little key to a shared machine.

1990s Encryption

goes everywhere, scrambling secrets in transit. 🦉

2010s Two-step login

spreads, adding a second gentle gate.

Today Passkeys

begin to retire the password altogether.

It takes a few friends

 **You** The keeper of your own keys — the most important guardian of all.

 **Your helper** A trusted friend or IT pal for the moments that feel too big.

 **The makers** The folks who patch the apps and keep the lamps lit behind the scenes.

 **Future you** The one who'll thank today's you for the spare copy and the careful share.

A friendly **starter** path

1

Day 1

Turn on two-step login for your email — the master key to everything.

2

Day 2

Install a password manager and let it invent strong, unique keys.

3

Day 4

Walk through old shared links and retire the ones you've forgotten.

4

Day 7

Set up one automatic backup, kept somewhere separate. Then rest. 🦉

THE WHOLE PICTURE

One safe little **village**

Strong keys, careful sharing, and a spare copy — that's
the whole story.

A TINY EXAMPLE

Lock the **door** in one line

A backup is just a habit a computer can keep for you. Here's the friendly version 🦊 — schedule a copy, somewhere apart, every night while you sleep.

```
# Copy today's files to a safe, separate home – every night at 2am  
rclone sync ~/Documents remote:nightly-backup \  
  --backup-dir remote:attic/$(date +%F) \  
  --log-level INFO
```

Carry **these** with you

Pro tip — A password manager is a friend, not a chore. Let it remember the keys so your brain can hold the *one* that unlocks it.

Watch out — "Anyone with the link" really does mean *anyone*. Before you share, ask: would I mind a stranger finding this? If yes, set an expiry.

A LITTLE WISDOM

*Safety in the cloud isn't a **fortress** —
it's a handful of small, kind habits,
kept every day.*

REMEMBER

You don't need to be perfect. 🐻

You just need to be a little *careful*, a little *consistent*, and kind to your future self.

THE END

Stay **cosy**, stay safe

Unique keys, careful sharing, a spare copy. That's all
it takes. 🐻 🦊 🦉
